4 3	Paper 3 Advanced Practical Skills 2			October/November 2020			
1 4					2 hours		
0 2	You must answe	er on the question	paper.				
4 *	You will need: The materials and apparatus listed in the confidential instructions						
	Answer all	-					
	• Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.						
	 Write your name, centre number and candidate number in the boxes at the top of the page. Write your answer to each question in the space provided. 						
	Do not use an erasable pen or correction fluid.						
	 Do not write on any bar codes. You may use a calculator. 						
	 You should show all your working, use appropriate units and use an appropriate number of significant figures. 						
 Give details of the practical session and laboratory, where appropriate, in the boxes provided. 			Session

This document has **16** pages. Blank pages are indicated.

Quantitative Analysis

Read through the whole method before starting any practical work. Where appropriate, prepare a table for your results in the space provided.

Show your working and appropriate significant figures in the final answer to **each** step of your calculations.

1 Many hydrated salts lose water of crystallisation when heated. You will identify the metal in a hydrated salt by heating the salt until it becomes anhydrous.

The equation for the dehydration of the hydrated salt, X•16H₂O, is shown.

 $X \cdot 16H_2O(s) \rightarrow X(s) + 16H_2O(g)$

FB 1 is the hydrated salt, $X \cdot 16H_2O$.

(a) Method

- Weigh a crucible with its lid and record the mass.
- Add between 1.8g and 2.0g of **FB 1** to the crucible.
- Weigh the crucible and lid with **FB 1** and record the mass.
- Place the crucible on the pipe-clay triangle. Gently heat the crucible and contents for approximately two minutes with the lid on.
- Remove the lid. Then heat the crucible and contents strongly for approximately four minutes.
- Replace the lid and leave the crucible and residue to cool for at least five minutes.

While the crucible is cooling, you may wish to begin work on Question 2 or 3.

- Reweigh the crucible and contents with the lid on. Record the mass.
- Remove the lid. Heat the crucible and contents strongly for a further two minutes.
- Replace the lid and leave the crucible and residue to cool for at least five minutes. Then reweigh the crucible and contents with the lid on. Record the mass.
- Calculate and record the mass of FB 1 added to the crucible and the mass of residue obtained.

[5]

(b) Calculations

(i) Calculate the number of moles of water of crystallisation lost during heating of FB 1.

moles of H_2O lost = mol [1]

(ii) Use your answer to (b)(i) to calculate the number of moles of anhydrous residue, X, produced by the heating in (a).

moles of X produced = mol [1]

(iii) Calculate the relative formula mass of X.

*M*_r of X = [1]

(iv) X is the sulfate of a metal in Group 13 of the Periodic Table.

Calculate the relative atomic mass of the metal. Show your working.

- 4
- 2 In this experiment, you will determine the concentration of an alkali. You will mix different volumes of acid with a fixed volume of alkali and measure the temperature rise that occurs each time. You will then determine the enthalpy change for the neutralisation of the acid with the alkali.

FB 2 is aqueous sodium hydroxide, NaOH. **FB 3** is 1.95 mol dm^{-3} sulfuric acid, H_2SO_4 .

(a) Method

• Use the thermometer to measure and record the initial temperature of **FB 2**.

initial temperature of **FB 2** =°C

- Support a plastic cup in the 250 cm³ beaker.
- Fill one burette with **FB 3**. Label this burette **FB 3**.
- Fill the other burette with distilled water.

Experiment 1

5

6

- Use the 10 cm³ pipette to transfer 10.0 cm³ of **FB 2** into the plastic cup.
- Add 8.00 cm³ of distilled water from the burette into the plastic cup.
- Add 2.00 cm³ of **FB 3** from the burette into the plastic cup.
- Stir the mixture and measure the maximum temperature reached. (You may need to tilt the cup so that the bulb of the thermometer is completely immersed.) Record the maximum temperature.
- Empty, rinse and shake dry the plastic cup, ready for use in **Experiment 2**.

0.00

experiment	volume of FB 2 /cm ³	volume of H ₂ O/cm ³	volume of FB 3/cm ³	maximum temperature/°C
1	10.0	8.00	2.00	
2	10.0	6.00	4.00	
3	10.0	4.00	6.00	
4	10.0	2.00	8.00	

• Repeat this procedure to carry out experiments 2 to 5, using the volumes of **FB 2**, water and **FB 3** shown in the table. Record the maximum temperature reached in each experiment.

Ι	
II	
III	
IV	
V	

Carry out **one** further experiment which will enable you to determine more precisely the minimum volume of **FB 3** that gives the highest maximum temperature. This is **Experiment 6**. Record the volumes of water and **FB 3** and the maximum temperature in the table above. [5]

10.00

(b) On the grid opposite, plot a graph of maximum temperature reached on the *y*-axis and volume of **FB 3** on the *x*-axis.

Select a scale on the *y*-axis which includes a temperature 3.0 °C above the maximum temperature reached.

Label any points you consider to be anomalous.

10.0

10.0

5

I II III IV

Draw two **straight** lines of best fit on your graph. The first line is for increasing maximum temperature and the second after the maximum temperature was reached.

Extrapolate the two lines so that they intersect.

Use your graph to determine the volume of **FB 3** that reacts with 10.0 cm³ of **FB 2**.

volume of **FB 3** = cm³ [4] (c) (i) Calculate the change in energy when the volume of FB 3 in (b) is neutralised by FB 2, sodium hydroxide.
 Assume that 4.2 J of energy changes the temperature of 1.0 cm³ of solution by 1.0 °C.

energy change = J [1]

(ii) Calculate the number of moles of sulfuric acid in the volume of FB 3 in (b). (If you were unable to answer 2(b), use 5.70 cm³ as the volume of FB 3.)

moles of H_2SO_4 = mol [1]

(iii) Calculate the enthalpy change of neutralisation, in kJ mol⁻¹, for 1.00 mol of H_2SO_4 reacting with **FB 2**.

enthalpy change of neutralisation =	kJ mol ⁻¹ [1]
sign	value

(iv) Write the equation for the neutralisation of FB 3 with FB 2. Include state symbols.

......[1]

(v) Use your answer to (c)(ii) and the information on page 4 to calculate the concentration, in mol dm⁻³, of NaOH in FB 2.

concentration of NaOH in **FB 2** = mol dm⁻³ [1]

(d) Apart from using a more accurate thermometer, better insulation or taking more readings, suggest **one** modification to the **procedure** which would make the value for the enthalpy change of neutralisation calculated in (c)(iii) more accurate.

......[1]

[Total: 15]

Qualitative Analysis

Where reagents are selected for use in a test, the **name** or **correct formula** of the element or compound must be given.

At each stage of any test you are to record details of the following:

- colour changes seen
- the formation of any precipitate and its solubility in an excess of the reagent added
- the formation of any gas and its identification by a suitable test.

You should indicate clearly at what stage in a test a change occurs.

If any solution is warmed, a **boiling tube** must be used.

Rinse and reuse test-tubes and boiling tubes where possible.

No additional tests for ions present should be attempted.

3 The following information about the redox properties of some anions will be helpful.

anion	property	
nitrite	easily oxidised	
nitrate	cannot be oxidised	
sulfite	easily oxidised	
sulfate	cannot be oxidised	

FB 4 and **FB 5** are solutions each containing one cation and one anion. Both anions are listed in the Qualitative Analysis Notes. (a) Carry out the tests and record your observations in the table. Use a 1 cm depth of **FB 4** or **FB 5** in a test-tube for each test.

44	observations		
test	FB 4	FB 5	
Test 1 Add an equal volume of aqueous sodium carbonate.			
Test 2 Add aqueous ammonia.			
Test 3 Add a few drops of aqueous barium nitrate (or aqueous barium chloride).			
Test 4 Add an equal volume of dilute nitric acid. Allow to stand for one minute, then			
add a few drops of aqueous silver nitrate.			

[4]

(b) Carry out the following tests in boiling tubes and record your observations in the table. Use a 1 cm depth of **FB 4** or **FB 5** for each test.

toot	observations		
test	FB 4	FB 5	
Test 1 Add aqueous sodium hydroxide, then			
warm the mixture gently and carefully, then			
add one piece of aluminium foil to the mixture.			

- (c) Using the information given at the start of the question, select **one** further test to enable you to identify the anions present in each of **FB 4** and **FB 5**.
 - State the reagent(s) you will use for this test.
 - Explain why this test will enable you to identify the anions in **FB 4** and **FB 5**.
 - Carry out your test and record the observations.

reagent(s)	
explanation	
observations	

ſ	З	1

(d) Write the formulae of the anions and cations present in FB 4 and FB 5.If the tests you carried out did not allow you to identify the ion, write 'unknown'.

	FB 4: cation	anion	
	FB 5: cation	anion	
			[2]
(e)	Give the ionic equation for one precipitation react Include state symbols.		[1]
			[1]

manganese(II), Mn²⁺(aq)	off-white ppt. rapidly turning brown on contact with air insoluble in excess	off-white ppt. rapidly turning brown on contact with air insoluble in excess		
zinc, Zn²⁺(aq)	white ppt. soluble in excess	white ppt. soluble in excess		

2 Reactions of anions

ion	reaction
carbonate, CO ₃ ²⁻	CO ₂ liberated by dilute acids
chloride, C <i>l</i> ⁻(aq)	gives white ppt. with Ag ⁺ (aq) (soluble in $NH_3(aq)$)
bromide, Br⁻(aq)	gives cream ppt. with Ag ⁺ (aq) (partially soluble in $NH_3(aq)$)
iodide, I⁻(aq)	gives yellow ppt. with Ag⁺(aq) (insoluble in NH₃(aq))
nitrate, NO ₃ ⁻(aq)	NH_3 liberated on heating with $OH^-(aq)$ and Al foil
nitrite, NO₂⁻(aq)	NH_3 liberated on heating with $OH^-(aq)$ and Al foil
sulfate, SO ₄ ²-(aq)	gives white ppt. with Ba ²⁺ (aq) (insoluble in excess dilute strong acids)
sulfite, SO ₃ ^{2–} (aq)	gives white ppt. with Ba ²⁺ (aq) (soluble in excess dilute strong acids)

3 Tests for gases

gas	test and test result
ammonia, NH ₃	turns damp red litmus paper blue
carbon dioxide, CO ₂	gives a white ppt. with limewater (ppt. dissolves with excess CO ₂)
chlorine, Cl_2	bleaches damp litmus paper
hydrogen, H ₂	'pops' with a lighted splint
oxygen, O ₂	relights a glowing splint
