Total	80					

### ADDITIONAL MATERIALS

In addition to this examination paper you will need a calculator and a ruler.

### INSTRUCTIONS TO CANDIDATES

Use black ink or black ball-point pen. Do not use gel pen or correction fluid.

Write your name, centre number and candidate number in the spaces at the top of this page.

Answer all questions.

Write your answers in the spaces provided in this booklet. If you run out of space, use the additional page(s) at the back of the booklet, taking care to number the question(s) correctly.

#### **INFORMATION FOR CANDIDATES**

The number of marks is given in brackets at the end of each question or part-question.

Question **4**(b) is a quality of extended response (QER) question where your writing skills will be assessed.

The Periodic Table is printed on the back cover of this paper and the formulae for some common ions on the inside of the back cover.

			Answer all	questions.

(c) A class used the apparatus shown to compare the combustion of different alcohols. They burned each alcohol for 1 minute. They measured the temperature of the water before and after burning each alcohol.

5

The table shows the increase in temperature of the water for each alcohol.

Alcohol	Temperature increase (°C)
methanol	8
ethanol	19
propanol	23
butanol	38

(i) The starting temperature of the water each time was 18 °C. Calculate the final temperature of the water after burning ethanol. [1]

Final temperature = .....°C

Examiner only

(b) In a different experiment, using the apparatus shown below, the volume of carbon dioxide produced at 35 °C was measured and recorded every 10 minutes for 60 minutes.

Time (minutes)	Volume of carbon dioxide produced (cm <sup>3</sup> )
0	0
10	6
20	12
30	17
40	25
50	30
60	36

		Examiner
(ii)	Use the graph to find the volume of carbon dioxide produced after 25 minutes. [1]	only
	Volume cm <sup>3</sup>	
(iii)	Use the data to <b>estimate</b> how long it would take to produce 100 cm <sup>3</sup> of carbon dioxide gas. Assume that the rate of the reaction does not change. [1]	
	Time = minutes

(ii) Aluminium oxide contains the ions Al<sup>3+</sup> and O<sup>2−</sup>.
Give the formula of aluminium oxide. [1]
(iii) Iron oxide is reduced by heating with carbon in a blast furnace.
Tick (✓) the box that states why aluminium oxide cannot be reduced in this way. [1]
carbon is more reactive than aluminium
iron is more reactive than aluminium
aluminium is more reactive than carbon

5. Plant and crop growth can be improved using fertilisers containing nitrogen. Fertilisers are substances that are added to the soil in order to increase the supply of nutrients that boost the growth of plants. With the rapid increase in global population, the demand for food has been rising tremendously. It is estimated that 40-60% of agricultural crops are now grown with the use of different types of fertilisers. Many fertilisers are produced using ammonia.

When you use too much fertiliser in the soil, it can lead to eutrophication. Fertilisers contain substances like nitrates and phosphates that are washed into lakes, oceans and rivers by rain water. These substances lead to excessive growth of algae and plants in the waterways resulting in a decrease in the levels of oxygen. The decrease in oxygen levels leads to the death of fish and other aquatic animals and contributes to changes in food chains.

Figure 1 shows the relative populations of world continents in 2016.

Figure 2 shows the relative world consumption of ammonia in 2016.

(a) (i) Tick (✓) **three** boxes that state the effects of fertiliser use which contribute to the death of aquatic animals in eutrophication. [2]

17

crop growth on fields increases	
fertilisers run into waterways	
plant growth in rivers and lakes increases	
aquatic animals do not have enough oxygen	
farmers' profits increase	

State whether the information in Figure 1 and Figure 2 shows a link between the number of people living on each continent and the amount of ammonia used. Give reasons for your answer.

Examiner only

Examiner only The label on a bag of fertiliser shows the formula of the nitrogen compound that the (b) fertiliser contains. 1.5 kg fertiliser  $(NH_4)_2SO_4$ Give the name of the compound  $(NH_4)_2SO_4$ . [1] (i) (ii) Tick ( $\checkmark$ ) the box that gives the correct reason why plants need nitrogen. [1] plants use nitrogen to make sugar plants use nitrogen to make water plants use nitrogen to make oxygen plants use nitrogen to make protein 1.5 kg of fertiliser treats an area of  $75 \text{ m}^2$ . Calculate the mass needed to treat a lawn with an area of  $15 \text{ m}^2$ . Give your answer in **grams**. (iii) [2]
